#### ALIGNMENTS

```
This peptide was isolated from the small intestine of a pig. The small instine is an important endocrine organ and many physiologically active peptides have been isolated from it. This peptide inhibits the growth of, and may kill, bacteria, pref. gram negative bacteria. This peptide or its functional derivatives may be used in human or veterinary medicine for the perpetic or prophylactic use. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                               New anti-bacterial polypeptide - active against Gram negative bacteria.
                                                                                                                             Pig; small intestine; endocrine; gram negative; bacteria; therapeutic; veterinary medicine; prophylactic.

The present peptide is a synducin, which induces the expression of syndecan-1 and syndecan-4 on the surface of mesenchymal cells, esp. fibroblasts and epithelial cells. The 36 N-terminal amino acids of the peptide were found to be identical to the 36 N-terminal amino acids of PR -39, a Pro and Arg rich antibacterial peptide previously found in porcine intestine (W09222578). Synducins may be used in the treatment of stasis and decubitus ulcers, keloids, skin burns, ischemic tissues and hypercoagulation states, prevention of tumour metastasis, restenosis inhibition and endothelial cell angiogenesis and proliferation induction. Human microvascular endothelial cells were assayed for syndecan-4 expression following exposure to 5 % wound fluid, dbcAMP (1 mM), the present peptide (10 microM) or a blank, to give respective cell surface syndecan-4 values (mOD/m in) of approx. 1.75, 1.70, 1.80 and 0.95
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modulating mesenchymal interaction by administration of synducin - used

The peptides inhibit STDS by either killing the infectious organism, impeding the infection mechanism or interrupting the replication cycle of the organism. Squalamine (an aminosterol host defence molecule of the dog fish shark Squalus acanthias) and PGLa (a gon antimicrobial peptide) analogues may also be useful in inhibiting STD infection and transmission
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inhibiting sexually transmitted disease e.g. HIV or herpes simplex - by administering magainin antimicrobial or squalamine cpd. to inhibit

This sequence represents the proline-arginine rich antimicrobial peptide PR39. The PR39 sequence was first isolated from porcine small intestine, and has also been identified in human and porcine neutrophila. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 also induces syndecan expression on mesenchymal cells. Syndecans are important in wound repair, showing that PR39 can be used in wound repair, as well as in antibacterial agents. This sequence, and the fragments of it shown in AAW01447-W01454, can be used in the method of the invention. The method of the invention is for inhibiting leukcyte superoxide anion (O2-b) production. The method compairs a daministering to a leukcyte a peptide (such as this sequence) capable of inhibiting leukcyte 02- production. The peptides can be used as medicaments for fighting infection by attracting leukcytes to a wound site and restricting infection by these the wound site caused by excessive oxygen radicals produced by these leukcytes. They can also be used to develop products for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Proline; arginine; peptide; reperfusion injury; neutrophil; endothelium; superoxide; neutrophil superoxide anion; chemotaxis; NADPH oxidase; coronary bypass; organ transplantation surgery.

Sequences AAW75722-W75732 are proline/arginine rich peptides that upon administration into a mammal's bloodstream reduce reperfusion injury cadministration into a mammal's bloodstream reduce reperfusion injury (production of reactive oxygen species, neutrophils adherence to condotherlium, and extravasation of neutrophils). These peptides have two requirements: they contain the consensus sequence PXXF, where P is a condition residue and X is any amino acid residue, which has been found to inhibit superoxide production, and secondly they have arginine residues adjacent to these motifs, required for effective inhibition. It was cetablished by structural and function analysis that a peptide should contain 4 or 6 of these motifs, and that inhibitory activity is correlated with the increase of length of peptides. The effectiveness of these peptides was determined by investigating the production of the neutrophil superoxide anion, and also the inhibition of neutrophil superoxide anion, and also the inhibition of neutrophil condasse to some extent. All of the peptides also inhibit neutrophil oxidase activity. PR-39 is believed, to be the most potent endogenous down regulator of NADPH oxidase yet discovered, and from the data conduction inhiny inhinced advanced in eliminating or reducing the reperfusion inhiny inhinced advanced in calminating or reducing the reperfusion inhiny indired advanced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the reperfusion injury induced adhesion and extraction of neutrophils. The peptides are also useful in connection with surgical procedures such as coronary bypass and organ transplantation surgery
                                                                                                        Reduction of reperfusion injury in temporarily occluded blood vessels by administration of a peptide which is rich in proline or arginine residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Angiogenesis; stimulation; PR-39; anoxia; myocardial infarction; myocardial ischaemia; proteasome.

                                                                                                                                                                                                                                                                                                                                        유
                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                           This invention relates to a method for the stimulation of angiogenesis in situ within a targeted collection of viable cells. The method comprises introducing, into the cytoplasm, at least 1 member of the PR-39 oligopeptide collective, which interacts with cytoplasmic proteasomes. Part of the proteolytic activity of the proteosomes is selectively angiogenesis. The method is used to induce angiogenesis in tissue that has suffered anoxia or infarction, e.g. myocardial infarction or chronic myocardial ischaemia, and also to study the mechanisms that control angiogenesis. The present sequence represents the PR-39 peptide from which peptide used in the method of the invention are derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Stimulation of angiogenesis and inhibition of proteasome mediated degradation in cells, by introduction of PR-39 oligopeptide or its N-terminal fragments or their conjugates, for use in anoxia and infarction
                          Stimulating angiogenesis in situ, useful e.g. for treating anoxia and infarction, by administering a PR-39 oligopeptide that regulates enzymatic activity of proteosomes.
                                                                                                                                                                                                                                                                                                                                           Gaps

Peptides AAB97277 - AAB97279 represent PR-39 derived oligopeptides. PR-39 is a member of the the cathelin family of proteins, mature PR-39 represented by the present sequence is 39 amino acids in length, and has been shown to play a role in several inflammatory events including wound healing and myocardial infarction. The PR-39 derived family of

```
oligopeptides cause selective inhibition of proteasome mediated degeneration of peptides and stimulation of angiogenesis after their intracellular introduction to a target cell. PR-39 derived peptides are able to interact with at least the alpha7 subunit of the proteasomes, and therefore alter the proteolytic activity of proteasomes such that a selective increased expression of specific proteins occurs. The invention includes methods for the selective inhibition of proteasome mediated peptide degradation. The method provides means for stimulating angiogenesis as required in living tissues and organs which have suffered of chronic myocardial ischaemia of heart tissue. Examples are the myocardial ischaemia of heart tissue. Examples are the myocardian, skeletchal or smooth muscle, artery or vein, lung, brain, kidney, spleen, liver, gastrointestinal or nerve tissues, limbs, and extremities. A particular example is after myocardial infarction or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a PR-39 protein. The specification describes PR-39 derived peptides, which are used for selective inhibition of IkappaBalpha degradation within a targeted cell collection in-situ. The method is useful for selectively inhibiting IkappaBalpha protein degradation in situ, decreasing the activity of NFkappaB transcription factor and selective control of NFkappaB-dependent gene expression in situ. The PR-39 derived peptides are useful in the treatment of myocardial infarction, chronic myocardial ischemia of heart disease and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Selective inhibition of IkappaBalpha degradation within targeted viable cell collection, involves interacting PR-39 oligopeptide with IkappaBalpha and proteasomes, and altering proteolytic activity of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel ophthalmic solution comprising a prostaglandin of the F-series and an antimicrobial peptide. A solution of the invention has hypotensive and ophthalmological activity. The solution is useful for the treatment of increased intraocular pressure, such as caused by glaucoma and for the reduction of ocular hypertension. The prostaglandin and the antimicrobial peptide work synergistically, to provide beneficial reduction in the incidence of irritant and toxic side effects such as hyperaemia, irritation and inflammation of conjunctiva, ocular cell dysplasia, iridial melanocyte hyperplasia, and hyperpigmentation, associated with the prior art prostaglandin compositions. The present sequence represents an antimicrobial peptide of the invention.

                                                     The present invention relates to a method of inhibiting leukocyte superoxide anion (02-) production and/or attracting leukocytes. The method comprises the use of proline-arginine (FR)-ird antimicrobial peptides or their truncated analogues. The method is useful for attracting a leukocyte e.g. a mammalian leukocyte, porcine leukocyte, a neutrophil, to a location, e.g. a wound site. The PR-rich peptides useful as medicaments to fight infection by attracting leukocytes to known site, while restricting tissue damage at the wound site cused the secessive oxygen radicals produced by these leukocytes. The present sequence represents a PR-rich antimicrobial peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Leucocyte ; superoxide anion; oxygen radical; proline-arginine; antimicrobial; antioxidant; NADPH oxidase ; p47phox; neutrophil;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to inhibiting leucocyte superoxide anion (02-)
production using a naturally occurring proline-arginine (PR)-rich
artimicrobial peptide known as PR-39 and its truncated analogs. The
method comprises contacting leucocytes with the peptide comprising 39 or
26 amino acids, for a time and under conditions effective to inhibit
10 closely superoxide anion production. The peptide inhibits the activity
of NADPH oxidase responsible for anion production, by binding to Src
homology 3 (5H3) domain of p47phox, which is a 47 kDa cytosolic protein
of the phagocytic NADPH oxidase complex. The leucocyte is a mammalian or
porcine leucocyte and the mammalian leucocyte is neutrophil. Another
method is also disclosed which employs a PR-39 analog that comprise 16
amino acids, where the sum of the proline and arginine residues in the
effective peptide is at least 66 or 74 % of the total number of amino
acids. This peptide inhibits leucocyte 02- production by the effective
binding to p47phox in whole calls, therefore interfering with the binding
of p47phox to p22phox. At least 14 or 25% of the amino acid residues in
the peptide are arginine residues. The method of the invention is useful
cor inhibiting leucocyte oxygen radical production. The peptides are
useful as medicaments for fighting infections by attracting leucocytes to
a wound site, yet restrict tissue damage at the wound site caused by
excessive and the service by these leucocytes. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibiting leukocyte oxygen radical production comprises contacting a leukocyte with a peptide, where the inhibition occurs as a consequence of binding between the peptide and p47phox.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to a vaccine comprising at least one antigen and at least one cathelicidin derived antimicrobial peptide or its derivative. The vaccine is useful for active immunization, especially of humans or animals without protection against the specific antigen. The cathelicidin derived antimicrobial peptide is useful in the preparation of an adjuvant for enhancing the immune response to at least one antigen, where the adjuvant enhances the uptake of at least one antigen, where the Sequences ABB07708-15 represent C-terminal fragments of antimicrobial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vaccine for active immunization or for preparing an adjuvant for enhancing an immune response to at least one antigen, comprises at least one antigen and at least one cathelicidin derived antimicrobial peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Vaccine, cathelicidin, antimicrobial; immunostimulant; immune response; antigen presenting cell; adjuvant; porcine; PR-39.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antilipemic; cardiant; vasotropic; antiarteriosclerotic; antidiabetic;

Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.

Disclosure; SEQ ID NO 6749; 378pp; English

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have cone or more asymmetrical 2'-0 alkyl modifications, the antisense sequence targets a human gene sequence. Also described and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (M) app8-100 criticals or glucose-6-phosphatase levels in a subject; producing (I); ctabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where introducing one or more asymmetrical modification in the sequence, where critican decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (MI) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (C) the subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apol-100, elevated or otherwise unwanted characterised by elevated or otherwise unwanted expression of apol-100, elevated or otherwise unwanted disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholesterolaemia, statin-resistant confidence of disorder e.g. diabetes or type-2 diabetes (CAD), coronary heart chisase (CHD) and atherosclerosis (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism. C related disorder e.g. diabetes or type-2 diabetes (CAD), relating the diseases as mentioned above, cancer (e.g. breast, colon or creating the diseases as mentioned above, cancer (e.g. breast, colon or colump cancer), neurological disease (e.g., Huntington disease

Screening for nucleotide sequences encoding antimicrobial peptides by generating peptide libraries in microorganisms, inducing expression of peptides, selecting cells and recovering nucleotide sequences from cells.

Example 1; Page 34; 59pp; English

The present invention describes a plasmid which is ligated with a pool of nucleotide sequences (NT) linked to an inducible promoter, to express a peptide (P) (an enzyme or mature (P) of less than 100 amino acids of peptide (P) (an enzyme or mature (P) of less than 100 amino acids of coptionally linked to a signal (P)), transformed into host cells and cultured in presence of an inducer to induce expression of the NT. A method of screening (I) a pool of nucleotide sequences to select a meleotide sequence encoding a peptide, comprises: (a) ligating a plasmid with the pool of NT; (b) transforming host cells which are sensitive to the peptide with the ligated plasmids; (c) screening the transformed cells to select viable cells; (d) cultivating the viable cells in the presence of an inducer to induce expression of NT; (e) selecting cells according to the effect of the inducer on cell growth; and (f) recovering according to the effect of the inducer on cell growth; and (f) recovering correcting a pool of nucleotide sequences to select a nucleotide sequence cencoding a peptide which is an antimicrobial peptide or an antimicrobial cenzyme active on bacteria and for finding and preparing a composition for treatment of human or animal. The antimicrobial peptide obtained using continual or animal. (I) may be employed in preservation of e.g. food/feed, paint formulations, detergents, cosmetics, medical devices such as prosthetic implants and also to disinfect and/or kill microbial cells on an object e.g. as an disinfectant for the treatment of biofillm. The peptides are useful for treating microbial infections and/or tumours. Peptides with improved bio-activity can be developed using (I). The peptides have no ω

```
AAW01447-W01454 represent fragments of the proline-arginine rich antimicrobial peptide PR39 (see AAW01446). The PR39 sequence was first cantimicrobial peptide PR39 (see AAW01446). The PR39 sequence was first cantimicated from porcine small intestine, and has also been identified in human and porcine neutrophils. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 also induces syndecan expression on mesenchymal cells. Syndecans are important in wound repair, showing that PR39 can be used in wound repair, as well as in antibacterial agents. These sequences, and PR39, can be used in the method of the invention. The method comprises administering to a leukocyte a coptide (such as this sequence) capable of inhibiting leukocyte of production. The peptides can be used as medicaments for fighting tissue infection by attracting leukocytes to a wound site caused by excessive oxygen radicals produced by these leukocytes. They can also be used to develop products for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inhibitor; leukocyte O2- production; proline-arginine rich peptide; pig; antimicrobial peptide; small intestine; human; neutrophil; bacteria; bank synthesis; protein synthesis; inhibitor; syndecan expression; mesenchymal cell; wound repair; superoxide anion; infection; leukocyte; tissue damage; oxygen radical; inflammatory disease; therapy.
negative effect on normal mammalian and/or eukaryotic cells. The present sequence represents an AMP (antimicrobial peptide) gene amino acid sequence, which is used in an example from the present invention
                                                                                                                                                   Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

proline-rich protein V-beta 1 precursor - rat
C;Species: Rattus norregicus (Norway rat)
C;Daccies: G-Jan-1995 #sequence_revision 06-Jan-1995 #text_change 09-Jul-2004
C;Accession: A51118; S39206
R;Courty, Y.; Rosinski-Chupin, I.; Rougeon, F.
J. Blol. Chem. 269, 520-527, 1994
A;Fitle: A new proline-rich protein precursor expressed in the salivary glands of the rat
A;Reference number: A53118; MUID:94103265; PMID:8276845

FEBS Lett. 362:65-69(1995).

-!- FUNCTION: Exerts antimicrobial activity. It is more effective against cram-negative bacteria than Gram-positive bacteria.

-!- SIMILARITY: Belongs to the cathelicidin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,

Application US/09739535

Patent No. 6794490

GENERAL INFORMATION:

APPLICANT: Cubier Pharmaceuticals, Inc.

TITLE OF INVENTION: NOVEL LIPOPEPTIDES AS ANTIBACTERIAL AGENTS

FILE REFERENCE: C060

CURRENT APPLICATION NUMBER: US/09/739,535

CURRENT FILING DATE: 2000-12-15

NUMBER OF SEQ ID NOS: 1

SEQ ID NO 1

LENGTH: 38
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 39

Sequence 2, Application US/08419066

Patent No. 5830933

GENERAL INFORMATION:
APPLICANT: Blecha, Frank

APPLICANT: Blecha, Frank

TITLE OF INVENTION: SYNTHETIC ANTIMICROBIAL PEPTIDE

NUMBER OF SEQUENCES: 2

CORRESPONDENCE ADDRESS:
ADDRESSEE: John M. Collins, Hovey, Williams, Timmons

ADDRESSEE: Collins
                                                                                                                                                                                                                                                                                                                                                                                                                                                  CITY: Kansas City

DS-08-950-777A-4-4

Patent No. 6713605

GENERAL INFORMATION:

TITLE OF INVERMINON: Synthetic Antimicrobial Peptide
APPLICANT: Shi, Jishu
TITLE OF INVERTION: Synthetic Antimicrobial Peptide
NUMBER OF SEQUENCES: 9
CORRESPONDENCE ADDRESS:
ADDRESSE: Hovey, Williams, Timmons & Collins
STREET: Adol Grand Blvd., Ste. 400
CITY: Kansas City
STATE: Missouri
COUNTRY: U.S.A.
ZIP: 64108
COMPUTER: EADABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: 1BM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/930,777A
FILING DATE: April 10, 1996
CLASSIFICATION: 530
PRIOR APPLICATION: 530
PRIOR APPLICATION NUMBER: PCT/US6/04674
FILING DATE: April 10, 1996
CLASSIFICATION NUMBER: 26,262
REFERENCE/DOCKET NUMBER: 26,263

US-10-014-147-1

Sequence 1, Application US/10014147

Sequence 1, Application US/10014147

Publication No. US20030125249A1

GENERAL INFORMATION:
Shi, Jishu
TITLE OF INVENTION: Synthetic Antimicrobial Peptide
NUMBER OF SEQUENCES: 9

CORRESPONDENCE ADDRESS:
ADDRESSE: Hovey, Williams, Timmons & Collins
STRRET: 2405 Grand Blvd., Ste. 400

CITY: Kansas City
STRATE: Massouri
COUNTRY: U.S.A.

ZIP: 64108

COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC Compatible
COMPUTER: Batentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION DATA:
APPLICATION NUMBER: US/08/930,777A
FILING DATE: October 8, 1997
APPLICATION NUMBER: BC. 109
PRIOR APPLICATION NUMBER: US/08/930,777A
FILING DATE: October 8, 1997
APPLICATION NUMBER: COLIUSE/O4674
FILING DATE: COLIUS, DADI M.
NAME: COLIUS, DOND M.
NAME: COLIUS, DOND M.
REPERENTING NUMBER: 25, 262
REFERENTING NUMBER: 23625-A

Inhibition of leukocyte super:oxide anion prodn. and attraction of leukocytes - using peptide(s) partic. based on antimicrobial PR-39.

Claim 3; Page 26; 45pp; English.

antimicrobial peptide PR39 (see AAW01446). The PR39 sequence was first isolated from porcine small intestine, and has also been identified in human and porcine neutrophils. PR39 kills bacteria by interfering with but and/or protein synthesis. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 also induces syndecan expression on mesenchymal cells. Syndecans are important in wound repair, showing that PR39 can be used in wound repair, as well as in antibacterial agents. These sequences, and PR39, can be used in the method of the invention. The method of the invention is for inhibiting leukocyte superoxide anion (O2-) production. The method comprises administering to a leukocyte a peptide (such as this sequence) capable of inhibiting leukocyte O2-

N

The peptides can be used as medicaments for fighting

```
definitistration into a mammal's bloodstream reduce repetitusion injury (production of reactive oxygen species, neutrophila deherence to endothellum, and extravasation of neutrophils). These peptides have two requirements: they contain the consensus sequence PXXP, where P is a proline residue and X is any amino acid residue, which has been found to inhibit superoxide production, and secondly they have arguine residues adjacent to these motifs, required for effective inhibition. It was established by structural and function analysis that a peptide should ideally contain 4 or 6 of these motifs, and that inhibitory activity is correlated with the increase of length of peptides. The effectiveness of these peptides was determined by investigating the production of the neutrophil superoxide anion, and also the inhibition of neutrophil chemotaxis. From this, it was found that all of the peptides inhibit neutrophil oxidase to some extent. All of the peptides also inhibit neutrophil oxidase to some extent. All of the peptides also inhibit neutrophil oxidase activity. PR-39 is believed, to be the most potent endogenous produced, it can be suggested to be involved in eliminating or reducing the reperfusion injury induced adhesion and extraction of neutrophils.
                                                                                                                                                                                                    ö
                  infection by attracting leukocytes to a wound site and restricting tissue damage at the wound site caused by excessive oxygen radicals produced by these leukocytes. They can also be used to develop products for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Proline; arginine; peptide; reperfusion injury; neutrophil; endothelium; superoxide; neutrophil superoxide anion; chemotaxis; NADPH oxidase; coronary bypass; organ transplantation surgery.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method of inhibiting leukocyte superoxide anion (02-) production and/or attracting leukocytes. The method comprises the use of proline-arginine (PR)-rich antimicrobial peptides or their truncated analogues. The method is useful for attracting a leukocyte e.g. a mammalian leukocyte, porcine leukocyte, a neutrophil, to a location, e.g. a wound site. The PR-rich peptides useful as medicaments to fight infection by attracting leukocytes to wound site, while restricting tissue damage at the wound site caused kecessive oxygen radicals produced by these leukocytes. The present sequence represents a PR-rich antimicrobial peptide.
                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           administering peptide including peptide or its truncated analogs

The invention relates to inhibiting leucocyte superoxide anion (02-) production using a naturally occurring proline-arginine (PR)-rich antimicrobial peptide known as PR-39 and its truncated analogs. The antimicrobial peptide known as PR-39 and its truncated analogs. The method comprises contacting leucocytes with the peptide comprising 39 or 56 amino acids, for a time and under conditions effective to inhibit comprising services superoxide anion production. The peptide inhibits the activity of NADPH oxidase responsible for anion production, by binding to Src composer to Analogy 3 (SH3) domain of p47phox, which is a 47 kDa cytosolic protein of the phagocytic NADPH oxidase complex. The leucocyte is a mammalian or porcine leucocyte and the mammalian leucocyte is neutrophil. Another comprise 16 control protein of a leo of selective peptide is at least 6 or 74 % of the total number of amino acids, where the sum of the proline and arginine residues in the condition of p47phox to p42phox in whole cells, therefore interfering with the binding to p47phox to p22phox. At least 14 or 25% of the amino acid residues in the peptide are arginine residues. The method of the invention is useful to method as medicaments for fighting infections. The peptides are conditioned for find a medicaments for fighting infections by attreacting leucocytes to a wound site, yet restrict tissue danage at the wound site caused by consequence is PR-39 analog PR-26.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibiting leukocyte oxygen radical production comprises contacting a leukocyte with a peptide, where the inhibition occurs as a consequence of binding between the peptide and p47phox.
                                                                                                                                                                    Leucocyte; superoxide anion; oxygen radical; proline-arginine; antimicrobial; antioxidant; NADPH oxidase; p47phox; neutrophil; infection; wound; tissue damage; PR-39 analog; PR-26.

This peptide was isolated from the small intestine of a pig. The small inestine is an important endocrine organ and many physiologically active peptides have been isolated from it. This peptide inhibits the growth of, and may kill, bacteria, pref. gram negative bacteria. This peptide or its functional derivatives may be used in human or veterinary medicine for therapeutic or prophylactic use. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                     New anti-bacterial polypeptide - active against Gram negative bacteria.

                                                                                                                                                                                                                                                                                                          AAR99116-R99123 are antimicrobial, magainin-analogue peptides that may be used to treat sexually transmitted diseases (STDS) caused by Chlamydia, HIV, herpes simplex virus, Neisseria gonnorhoeae or Candida infection. The peptides inhibit STDS by either killing the infectious organism, impeding the infection mechanism or interrupting the replication cycle of the organism. Squalamine (an aminosterol host defence molecule of the dog fish shark Squalus acanthias) and PCLa (a frog antimicrobial peptide) analogues may also be useful in inhibiting STD infection and transmission
                                                                                                                                                                                                                                                  Inhibiting sexually transmitted disease e.g. HIV or herpes simplex - by administering magainin antimicrobial or squalamine cpd. to inhibit

The 36 N-terminal amino acids of the peptide were found to be identical to the 36 N-terminal amino acids of PR-39, a Pro and Arg rich antibacterial peptide previously found in porcine intestine (W09222578). Synducins may be used in the treatment of stasis and decubitus ulcers, keloids, skin burns, ischemic tissues and hypercoagulation states, prevention of tumour metastasis, restenosis inhibition and endothelial cell angiogenesis and proliferation induction. Human microvascular endothelial cells were assayed for syndecan-4 expression following exposure to 5 % wound fluid, dboAMP (1 mM), the present peptide (10 microM) or a blank, to give respective cell surface syndecan-4 values (mOD/m in) of approx. 1.75, 1.70, 1.80 and 0.95
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibitor; leukocyte 02- production; proline-arginine rich peptide; pig; antimicrobial peptide; small intestine; human; neutrophil; bacteria; buts synthesis; protein synthesis; inhibitor; syndecan expression; mesenchymal cell; wound repair; supercoxide anion; infection; leukocyte; tissue damage; oxygen radical; inflammatory disease; therapy.

proline residue and X is any amino acid residue, which has been found to inhibit superoxide production, and secondly they have arginine residues adjacent to these motifs, required for effective inhibition. It was detablished by structural and function analysis that a peptide should ideally contain 4 or 6 of these motifs, and that inhibitory activity is correlated with the increase of length of peptides. The effectiveness of these peptides was determined by investigating the production of the neutrophil superoxide annon, and also the inhibition of neutrophil chemotaxis. From this, it was found that all of the peptides inhibit neutrophil they oxidase to some extent. All of the peptides inhibit neutrophil down regulator of NADPH oxidase yet discovered, and from the data produced, it can be suggested to be involved in eliminating or reducing produced, in inno induced and extraction of neutrophiles.

the reperfusion injury induced adhesion and extraction of neutrophils. The peptides are also useful in connection with surgical procedures such as coronary bypass and organ transplantation surgery

PR39. The PR39 sequence was first isolated from porcine small intestine, and has also been identified in human and porcine small intestine, and has also been identified in human and porcine neutrophils. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 also inwound repair, showing that PR39 can be used in wound repair, as well on wound repair, showing that PR39 can be used in wound repair, as well on AAW01447-W01454, can be used in the method of the invention. The method of the invention is for inhibiting leukocyte superoxide anion (O2-production. The method comprises administering to a leukocyte a peptide (such as this sequence) capable of inhibiting leukocyte Q2-production. The peptides can be used as medicaments for fighting infection by attracting leukocytes to a wound site and restricting tissue damage at the wound site caused by excessive oxygen radicals produced by these leukocytes. They can also be used to develop products for treating inflammatory disease states ö Proline; arginine; peptide; reperfusion injury; neutrophil; endothelium; superoxide; neutrophil superoxide anion; chemotaxis; NADPH oxidase; coronary bypass; organ transplantation surgery. represents the proline-arginine rich antimicrobial peptide Gaps ö Length 39; Indels 100.0%; Score 155; DB 2; 100.0%; Pred. ```
This invention relates to a method for the stimulation of angiogenesis in situ within a targeted collection of viable cells. The method comprises introducing, into the cytoplasm, at least I member of the PR-39 eligopeptide collective, which interacts with cytoplasmic proteasomes. Part of the proteolytic activity of the proteosomes is selectively altered so as to stimulate angiogenesis. The method is used to induce angiogenesis in tissue that has suffered anoxia or infarction, e.g. myocardial infarction or chronic myocardial ischaemia, and also to study the mechanisms that control angiogenesis. The present sequence represents the PR-39 peptide from which peptide used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Stimulating angiogenesis in situ, useful e.g. for treating anoxia and infarction, by administering a PR-39 oligopeptide that regulates enzymatic activity of proteosomes.
                                                                                                                                                              Angiogenesis; stimulation; PR-39; anoxia; myocardial infarction; myocardial ischaemia; proteasome.

Sequences AAW75722-W75732 are proline/arginine rich peptides that upon administration into a mammal's bloodstream reduce reperfusion injury (production of reactive oxygen species, neutrophil adherence to endothelium, and extravasation of neutrophils). These peptides have two requirements: they contain the consensus sequence PXXP, where P is a

Reduction of reperfusion injury in temporarily occluded blood vessels by administration of a peptide which is rich in proline or arginine

The present sequence represents a PR-39 protein. The specification describes PR-39 derived peptides, which are used for selective inhibition of IxappaBalpha degradation within a targeted cell collection in-situ. The method is useful for selectively inhibiting IxappaBalpha protein degradation in situ, decreasing the activity of NFkappaB transcription factor and selective control of NFkappaB dependent gene expression in situ. The PR-39 derived peptides are useful in the treatment of myocardial infarction, chronic myocardial ischemia of heart disease and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Selective inhibition of IkappaBalpha degradation within targeted viable cell collection, involves interacting PR-39 oligopeptide with IkappaBalpha and proteasomes, and altering proteolytic activity of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptides AAB97277 - AAB97279 represent PR-39 derived oligopeptides. PR-39 is a member of the the cathelin family of proteins, mature PR-39 is a member of the the cathelin family of proteins, mature PR-39 is represented by the present sequence is 39 amino acids in length, and has been shown to play a role in several inflammatory events including wound healing and myocardial infarction. The PR-39 derived family of collgopeptides cause selective inhibition of proteasome mediated degeneration of peptides and stimulation of angiogenesis after their introduction to a target cell. PR-39 derived peptides are able to interact with at least the alpha7 subunit of the proteasomes, and therefore alter the proteolytic activity of proteasomes such that a selective increased expression of specific proteins occurs. The invention includes methods for the selective inhibition of proteasome mediated candidation. The method provides means for stimulating angiogenesis as required in living tissues and organs which have suffered defects or have undergone anoxia and/or infarction, myocardial infarction of cronic myocardial is schaemia of heart tissue. Examples are the myocardium, skeletal or smooth muscle, artery or vein, lung, brain, kidney, spleen, liver, gastrointestinal or nerve tissues, limbs, and extremities. A particular example is after myocardial infarction or
                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Stimulation of angiogenesis and inhibition of proteasome mediated degradation in cells, by introduction of PR-39 oligopeptide or its N-terminal fragments or their conjugates, for use in anoxia and infarction

superoxide anion (02-) production and/or attracting leukocytes. The method comprises the use of proline-arginine (PR)-rich antimicrobial peptides or their truncated analogues. The method is useful for attracting a leukocyte e.g. a mammalian leukocyte, porcine leukocyte, or a neutrophil, to a location, e.g. a wound site. The PR-rich peptides are useful as medicaments to fight infection by attracting leukocytes to a wound site, while restricting tissue damage at the wound site caused by excessive oxygen radicals produced by these leukocytes. The present sequence represents a PR-rich antimicrobial peptide.
                                                                                                                                                                                                                                                           Attracting leukocyte to location by administering peptide including proline-arginine-rich antimicrobial peptide or its truncated analogs the location.
                                                                                                                                                                                                                                                                                                                                                                                          present invention relates to a method of inhibiting leukocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Leucocyte ; superoxide anion; oxygen radical; proline-arginine; antimicrobial; antioxidant; NADPH oxidase ; p47phox; neutrophil; infection; wound ; tissue damage ; PR-39 peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel ophthalmic solution comprising a prostaglandin of the F-series and an antimicrobial peptide. A solution of the invention has hypotensive and ophthalmological activity. The solution is useful for the treatment of increased intracoular pressure, such as caused by glaucoma and for the reduction of ocular hypertension. The prostaglandin and the antimicrobial peptide work spnergistically, to provide beneficial reduction in the incidence of irritant and toxic side effects such as hyperaemia, irritation and inflammation of conjunctiva,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ocular cell dysplasia, iridial melanocyte hyperplasia, and hyperplamentation, associated with the prior art prostaglandin compositions. The present sequence represents an antimicrobial peptide of

The invention relates to inhibiting leucocyte superoxide anion (02-)

production using a naturally occurring proline-arginine (PR)-rich
antimicrobial peptide known as PR-39 and its truncated analogs. The
method comprises contacting leucocytes with the peptide comprising 39 or
26 amino acids, for a time and under conditions effective to inhibit
CC 16 amino acids, for a time and under conditions effective to inhibit
CC 26 amino acids, for a time and under conditions effective to inhibit
CC 16 amino acids, where the anion production, by binding to Src
CC 17 homology 3 (SH3) domain of p47phox, which is a 47 kDa cytosolic protein
CC 17 homology 3 (SH3) domain of p47phox, which is a 47 kDa cytosolic protein
CC 18 also disclosed which employs a PR-39 analog that comprise 16
method is also disclosed which employs a PR-39 analog that comprise 16
CC 26 amino acids, where the sum of the proline and arginine residues in the
CC 27 acids. This peptide is at least 66 or 74 % of the total number of amino
CC 27 production by the effective
CC 28 pinding to p47phox in whole cells, therefore interfering with the binding
CC 29 production are arginine residues. The method of the invention is useful
CC 20 proline are arginine residues. The method of the invention is useful
CC 20 parallel as medicaments for fighting infections by attracting leucocytes to
CC 20 a wound site, yet restrict tissue damage at the wound site caused by
CC 20 production is produced by these leucocytes. The present

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
